Chirpy Starter

`gem` `v7.2.4`   `license` `MIT`

When installing the **Chirpy** theme through RubyGems.org, Jekyll can only read files in the folders `_data`, `_layouts`, `_includes`, `_sass` and `assets`, as well as a small part of options of the `_config.yml` file from the theme's gem. If you have ever installed this theme gem, you can use the command `bundle info --path jekyll-theme-chirpy` to locate these files.

The Jekyll team claims that this is to leave the ball in the user's court, but this also results in users not being able to enjoy the out-of-the-box experience when using feature-rich themes.

To fully use all the features of **Chirpy**, you need to copy the other critical files from the theme's gem to your Jekyll site. The following is a list of targets:

```
.
├── _config.yml
├── _plugins
├── _tabs
└── index.html
```

To save you time, and also in case you lose some files while copying, we extract those files/configurations of the latest version of the **Chirpy** theme and the CD workflow to here, so that you can start writing in minutes.

Usage

Check out the theme's docs.

Contributing

This repository is automatically updated with new releases from the theme repository. If you encounter any issues or want to contribute to its improvement, please visit the theme repository to provide feedback.
